

Early Intervention Considerations after a Suicide Attempt

Stephen O'Connor, PhD

National Institute of Mental Health

Crisis Jam

Invited Presentation

October 16, 2024

National Institute
of Mental Health

Disclosure

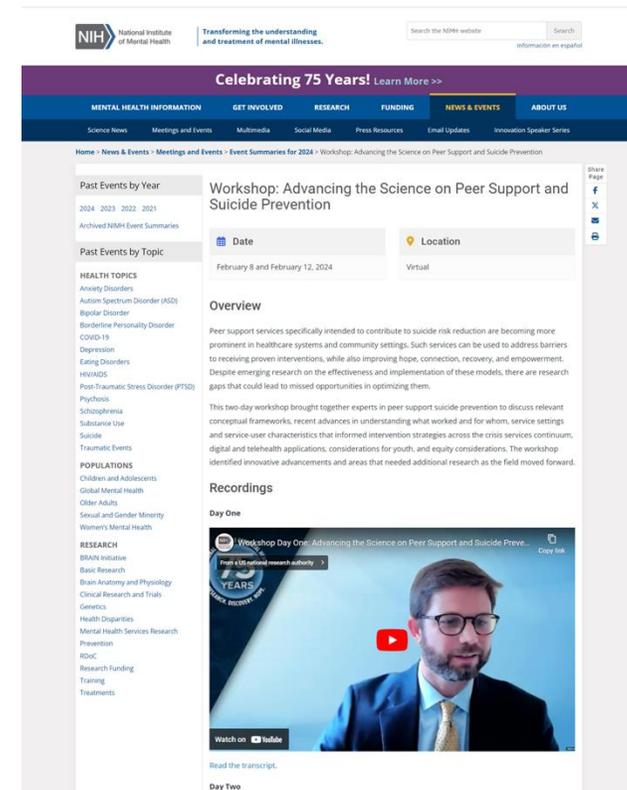

- This presentation includes research that was completed prior to Dr. O'Connor joining the NIMH. The opinions expressed in this presentation are the author's own and do not reflect the view of the National Institutes of Health, the Department of Health and Human Services, or the United States government.
- Funding to support this research

NIMH Crisis Response Suicide Prevention Initiatives

- Research Opportunities in Crisis Response Services for Suicide Prevention ([RFA-MH-25-135](#); [RFA-MH-25-136](#))
 - Effectiveness and implementation of crisis response services
 - Approaches to improve the quality and outcomes of services
 - Impact of state and local policy on implementation and outcomes.
- Research conducted in real-world settings
 - Wide range of clinical presentations, psychosocial factors, age-related characteristics (e.g., youth; adult; older adult), geographic context (rural/remote settings), racial, ethnic, and cultural considerations, and health disparities influence the types of care that are provided
- Second receipt date is June 2, 2025
- A [Notice of Special Interest \(NOT-MH-23-140\)](#) is also active through May 8, 2025

Peer Support Services for Suicide Prevention

- Experts in peer support suicide prevention discussed relevant conceptual frameworks, recent advances in understanding what works and for whom, service settings, and service-user characteristics that inform intervention strategies across the crisis services continuum, digital and telehealth applications, considerations for youth, and equity considerations
- <https://www.nimh.nih.gov/news/events/2024/workshop-advancing-the-science-on-peer-support-and-suicide-prevention>

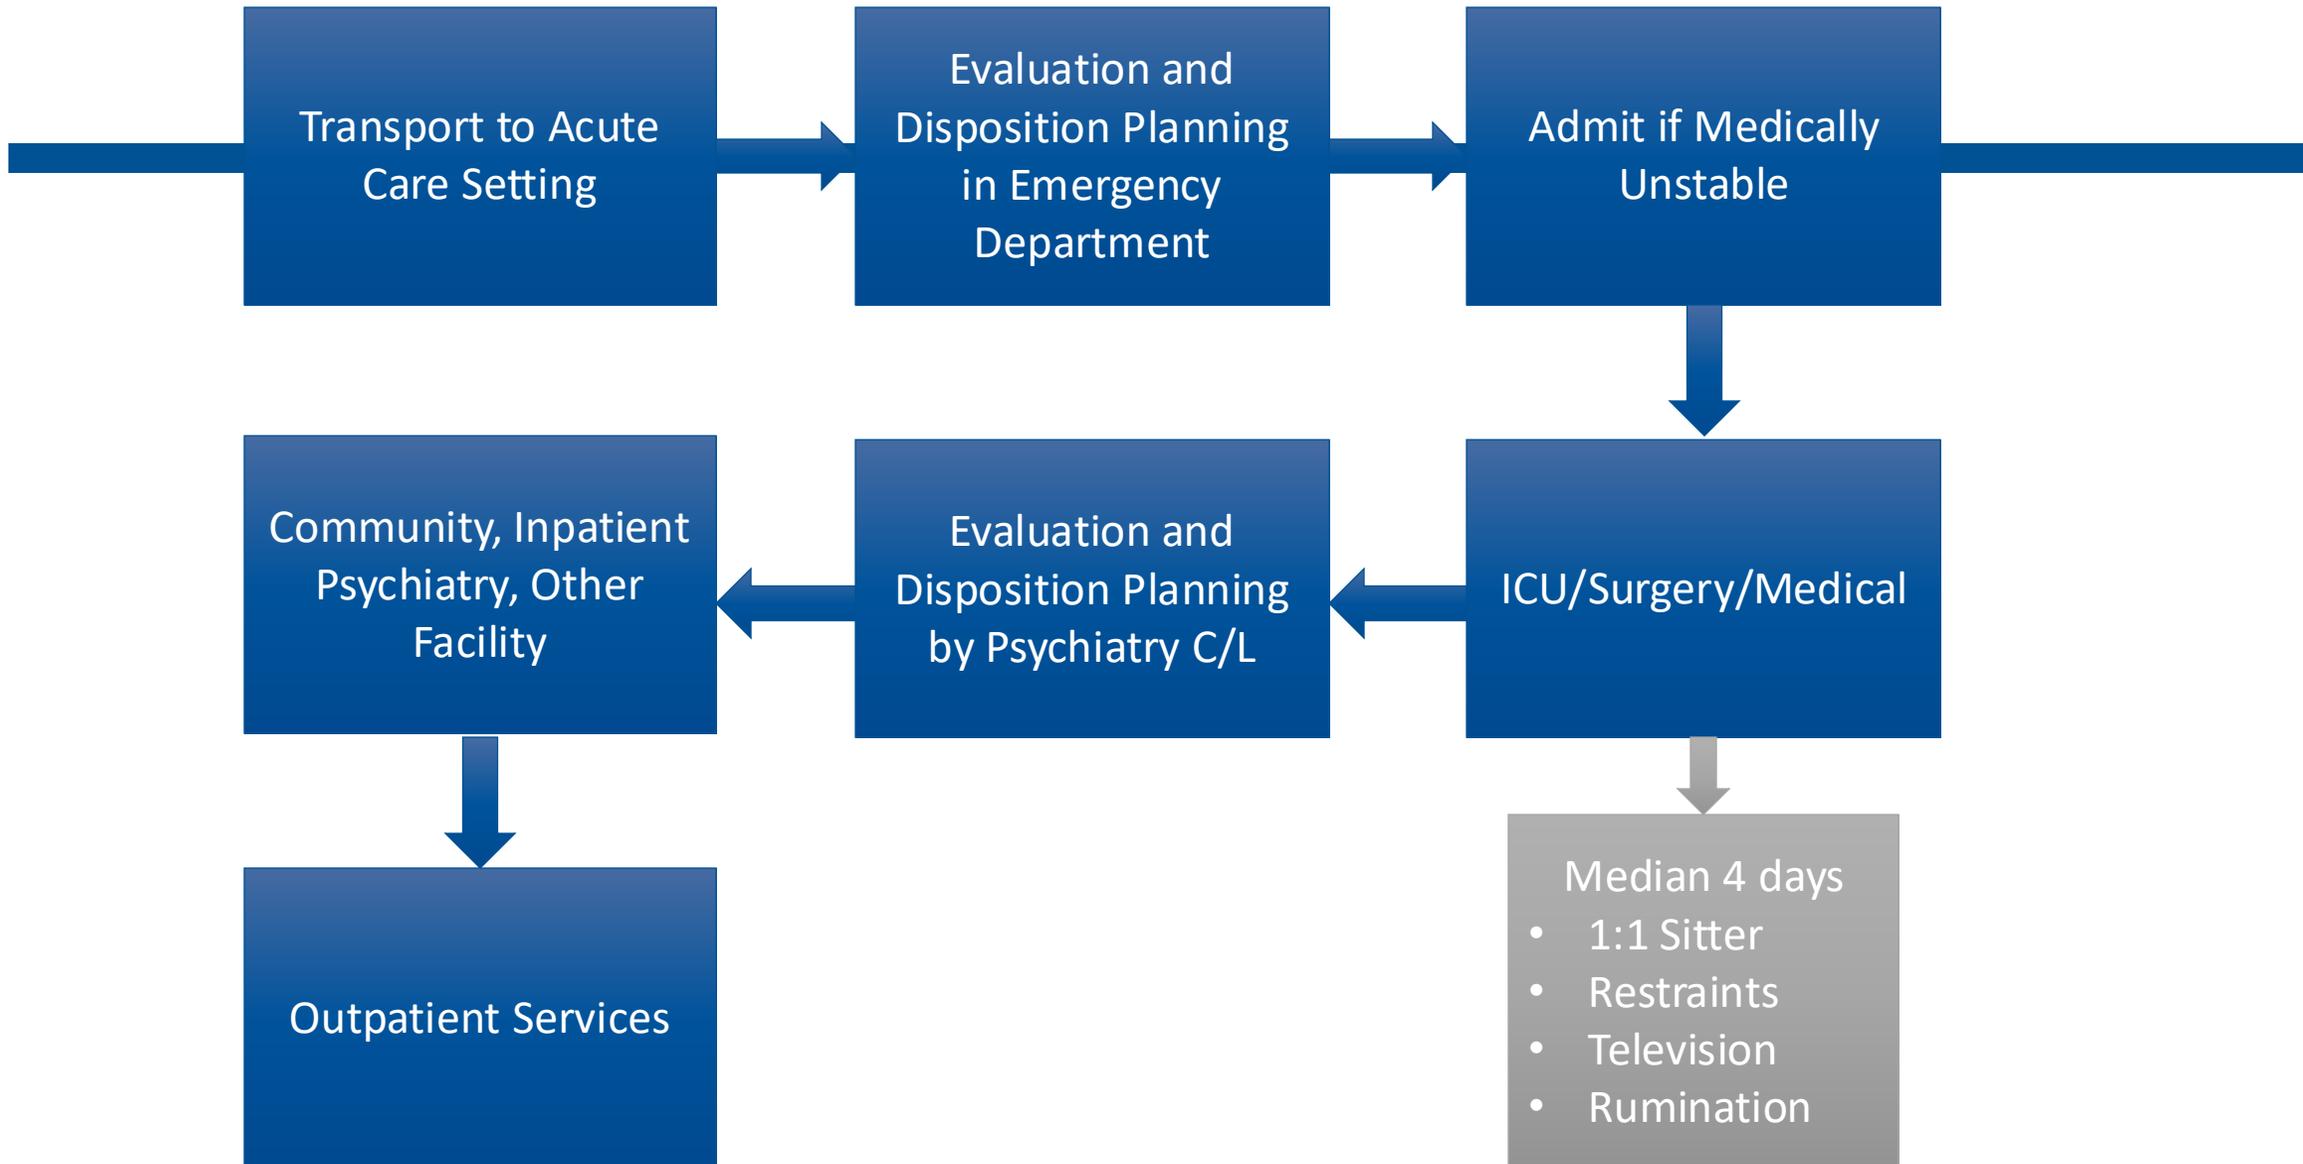

The screenshot shows the NIH website page for the workshop "Advancing the Science on Peer Support and Suicide Prevention". The page features a navigation bar with categories like "MENTAL HEALTH INFORMATION", "GET INVOLVED", "RESEARCH", "FUNDING", "NEWS & EVENTS", and "ABOUT US". The main content area includes a sidebar with "Past Events by Year" (2024, 2023, 2022, 2021) and "Past Events by Topic" (HEALTH TOPICS, MINDS, POPULATIONS, RESEARCH). The main content area displays the workshop title, dates (February 8 and February 12, 2024), location (Virtual), and an overview section. The overview text states: "Peer support services specifically intended to contribute to suicide risk reduction are becoming more prominent in healthcare systems and community settings. Such services can be used to address barriers to receiving proven interventions, while also improving hope, connection, recovery, and empowerment. Despite emerging research on the effectiveness and implementation of these models, there are research gaps that could lead to missed opportunities in optimizing them. This two-day workshop brought together experts in peer support suicide prevention to discuss relevant conceptual frameworks, recent advances in understanding what worked and for whom, service settings and service-user characteristics that informed intervention strategies across the crisis services continuum, digital and telehealth applications, considerations for youth, and equity considerations. The workshop identified innovative advancements and areas that needed additional research as the field moved forward." Below the overview is a "Recordings" section with a video player for "Workshop Day One: Advancing the Science on Peer Support and Suicide Prevention". The video player shows a man in a suit and glasses speaking. The page also includes a "Share Page" button and a "Read the transcript" link.

Helping Someone after a Suicide Attempt

PATIENT-CENTERED CARE

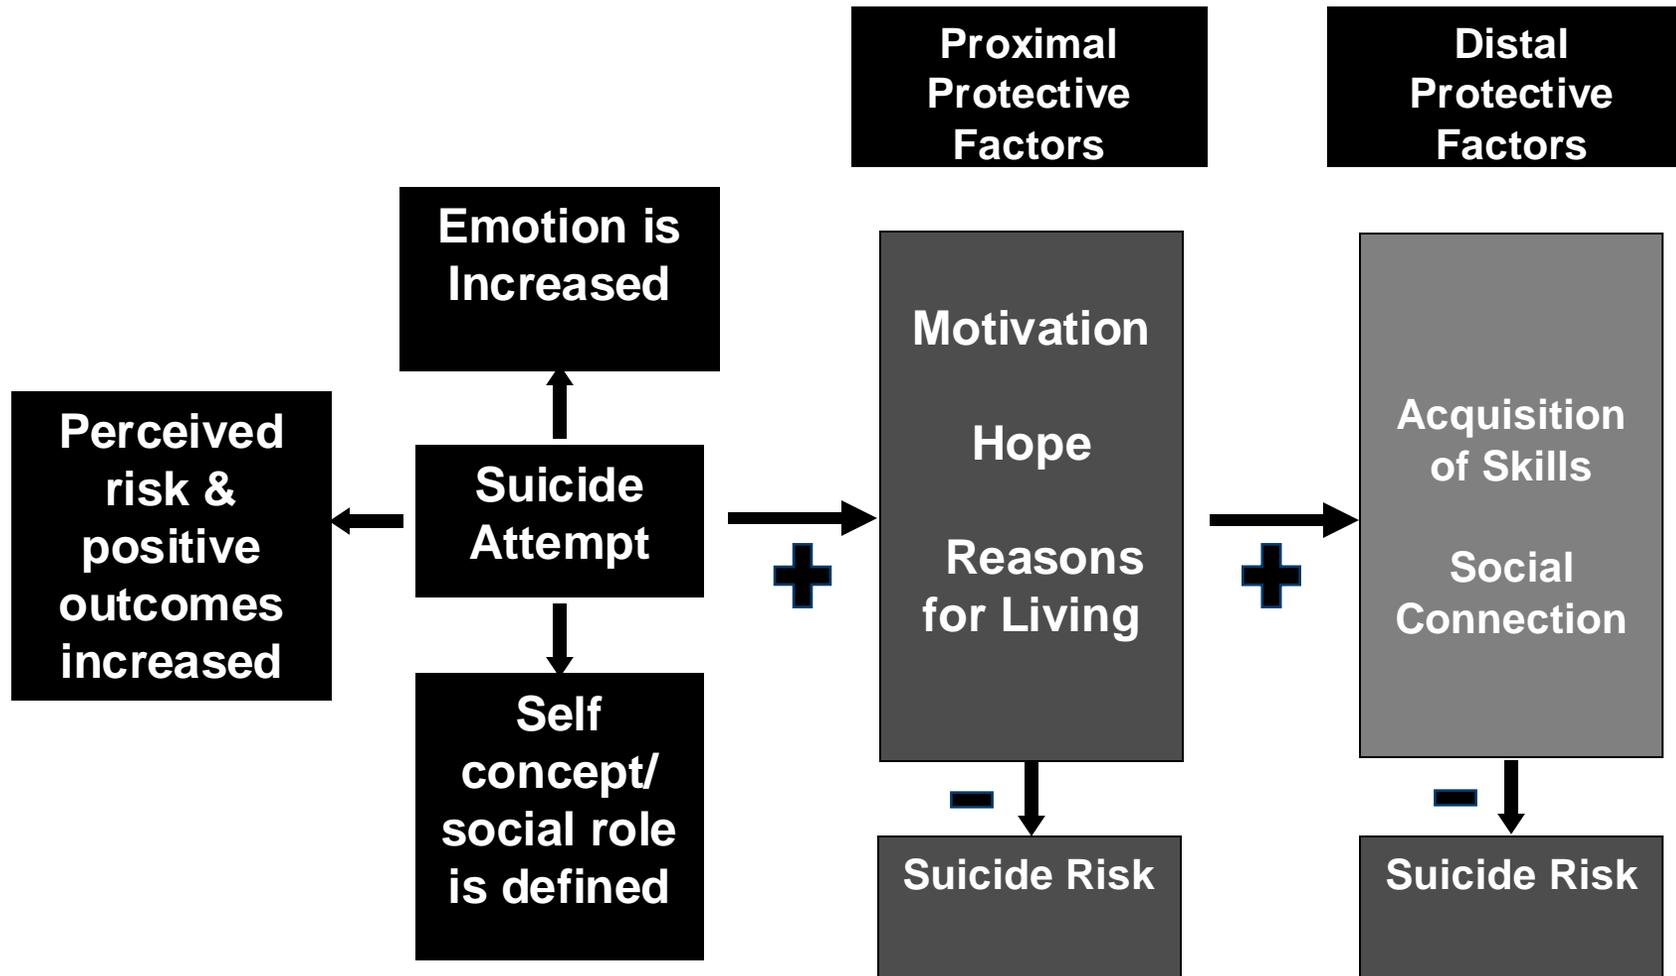

The Ultimate Goal

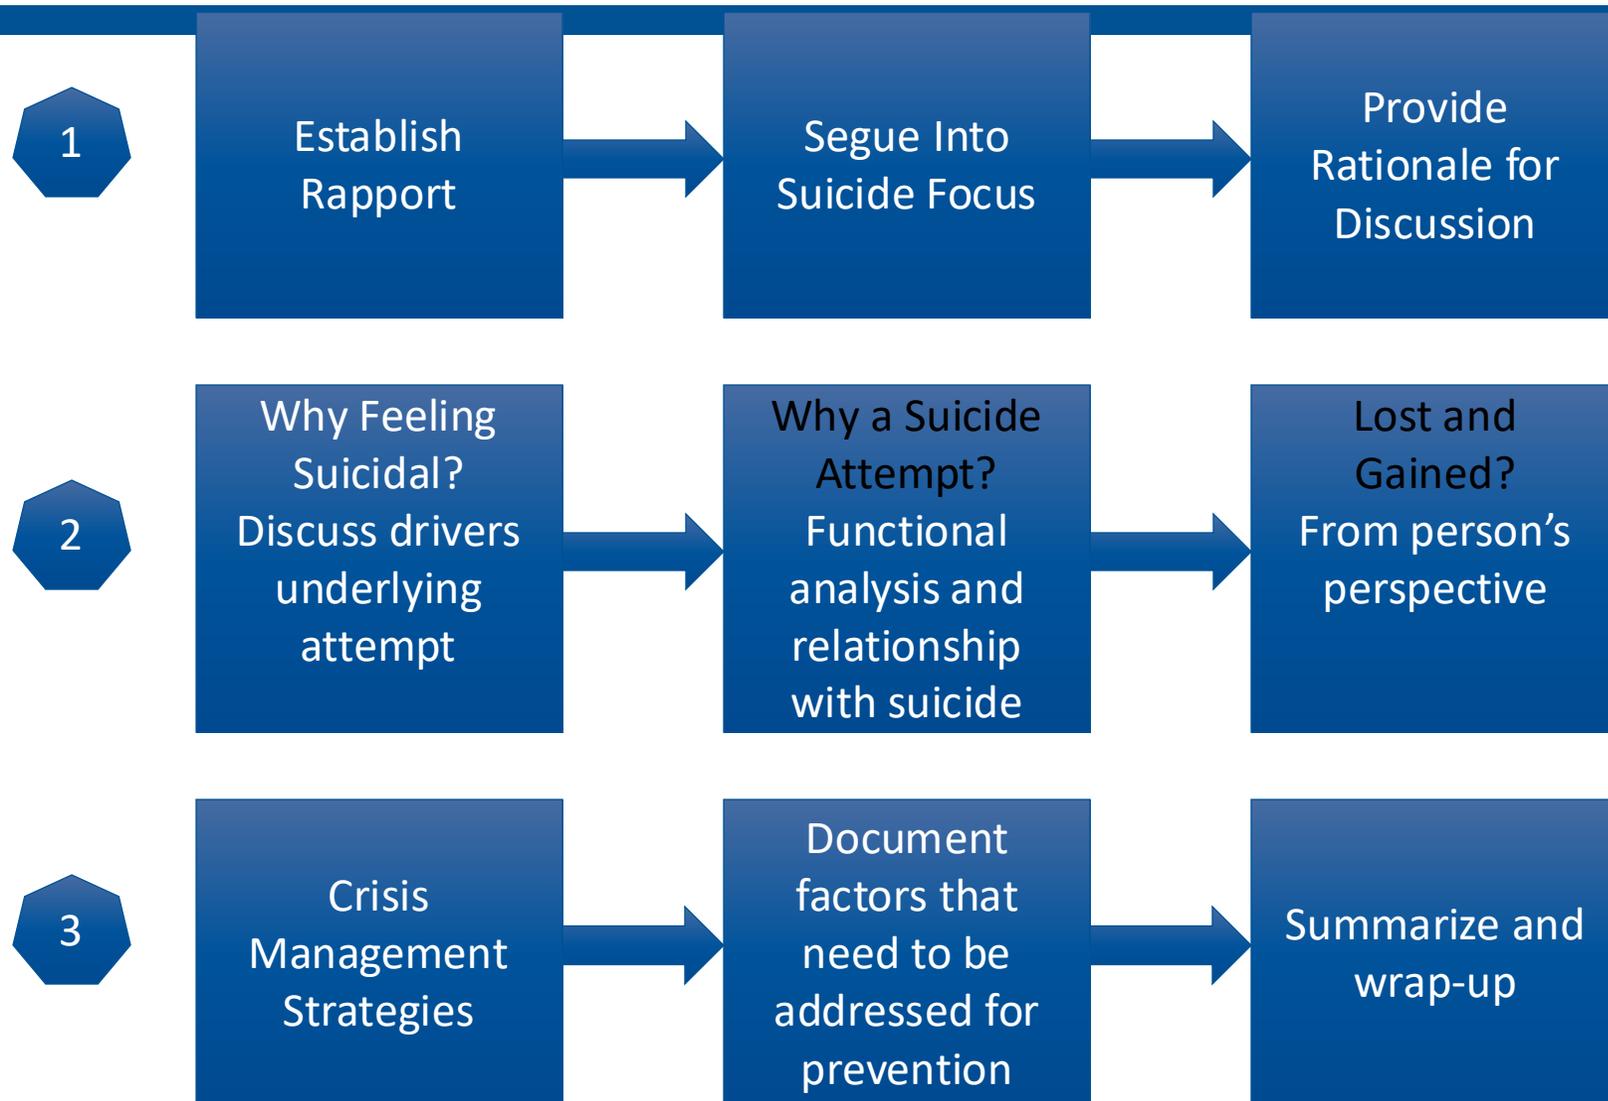

- How do we find the “sweet spot” where we are:
 - Maximizing the population impact of our interventions
 - Providing the appropriate “dose” that will lead to significant improvements
 - Introducing new approaches that can be scaled up rapidly and maintained
 - Matching individual preferences
 - Delivering an intervention that maps onto the key aspects of a conceptual model

Objective: The aim of this study was to further evaluate the acceptability and feasibility of the Teachable Moment Brief Intervention (TMBI).

Method: A single blind, pilot randomized controlled trial of the TMBI + care as usual (CAU) compared to CAU was conducted for patients who survived a recent suicide attempt that required medical inpatient hospitalization. The intervention was delivered on medical/surgical and inpatient psychiatry units in the medical center. Interviews were completed at baseline, 1, 3, and 12 months.

Results: Patients reported high ratings of satisfaction with the TMBI. Interventionists representing fields of Psychiatry, Social Work, and Counseling were able to deliver the intervention with fidelity to the treatment manual with equal adherence ratings. The TMBI patients were more likely to maintain a positive recovery trajectory on motivation and engagement in mental health services at 3 months.

Conclusion: The TMBI provides an option for targeted intervention to health care providers as they engage patients admitted to an acute medical setting after a serious suicide attempt. This is the second pilot study demonstrating enhanced motivation in the post-hospitalization period.

1. Introduction

Suicide is a global concern, accounting for approximately 800,000 deaths worldwide each year [1]. Suicide is the 10th leading cause of death in the United States, yet is the 2nd leading cause of death for people aged 15–34, the 3rd leading cause of death for adults aged 35–44, and the 5th leading cause of death among persons aged 45–54 [2]. In essence, suicide accounts for a disproportionate amount of premature mortality for individuals that would otherwise live to an older age and contribute in greater ways to society. While other causes of mortality like heart disease have steadily decreased [3], the rate of

times more likely in the week after hospital discharge and continues to be elevated for years [6–8]. For individuals treated on medical/surgical floors for injuries related to a suicide attempt, previous research suggests significantly elevated rates of suicide compared to the general population (odds ratio = 56, CI = 27–120) [9].

Previous research on smoking cessation [10] and alcohol-associated trauma hospitalizations [11] suggests that impactful cueing events (e.g., injuries, procedures) may lead to substantial behavior change over time. McBride and colleagues describe the intrapersonal factors following a cueing event in their conceptual model of teachable moments as involving a rapid increase in emotion, recognition of risks and

Abstract

Objective: To examine the associations between PTSD following a medically serious suicide attempt, interpersonal constructs, and outpatient mental health utilization.

Methods: The study utilized an existing dataset of patients recruited at a level 1 trauma center following a suicide attempt. Measures of suicide attempt-related constructs, perceived burdensomeness, thwarted belongingness, and health utilization were completed at 1 and 3 months. Path analysis models were used to analyze the data.

Results: Greater SA-PTS at 1 month was associated with suicidal ideation, thwarted belongingness, and perceived burdensomeness at 3 months.

Conclusions: Addressing PTSD following a medically serious suicide attempt may be important in addressing suicide-specific constructs and reducing hospitalization.

Emphasize a Recovery Perspective

- Recovery should be emphasized and supported at every step in the process
- A suicide attempt is an opportunity to understand someone's personal recovery and how to support them moving forward
- Focus on strategies and recovery outcomes that complement those that typically focus on risk reduction
- NIMH has encouraged post-acute intervention strategies (from [RFA-MH-22-125](#)):
 - “NIMH seeks applications to evaluate the preliminary effectiveness of therapeutic and service delivery interventions that utilize interpersonal treatment strategies to **reduce risk among suicidal individuals following acute care by enhancing perceived social supports and connections that contribute to life-affirming beliefs, intentions, and behaviors** and/or by promoting adherence/sustained engagement in appropriate mental health services.”
